Bitcoin Cash Infrastructure Roadmap

Bitcoin Cash is a peer-to-peer electronic cash system designed for the entire world. It is fast, inexpensive, and scalable, with low fees and confirmations in seconds. Bitcoin Cash is the result of a hard fork of the Bitcoin blockchain, which was created on August 1st, 2017 to increase the block size limit and allow for more transactions to be processed on the network. The Bitcoin Cash blockchain has been designed to be more scalable than the Bitcoin blockchain, with the ability to process more transactions per second and to support larger blocks. The Bitcoin Cash infrastructure roadmap includes plans for upgrades to the network that will further increase its scalability and speed, such as the implementation of a new consensus algorithm and the adoption of new technologies such as sharding and sidechains.

Our Vision

Bitcoin Cash is a peer-to-peer electronic cash system designed for the entire world. It is fast, inexpensive, and scalable, with low fees and confirmations in seconds.

Our Mission

Bitcoin Cash is a peer-to-peer electronic cash system designed for the entire world. It is fast, inexpensive, and scalable, with low fees and confirmations in seconds.

Our Values

Bitcoin Cash is a peer-to-peer electronic cash system designed for the entire world. It is fast, inexpensive, and scalable, with low fees and confirmations in seconds.
